CSE185 Introduction to Computer Vision Lab 07: Harris Corner Detection

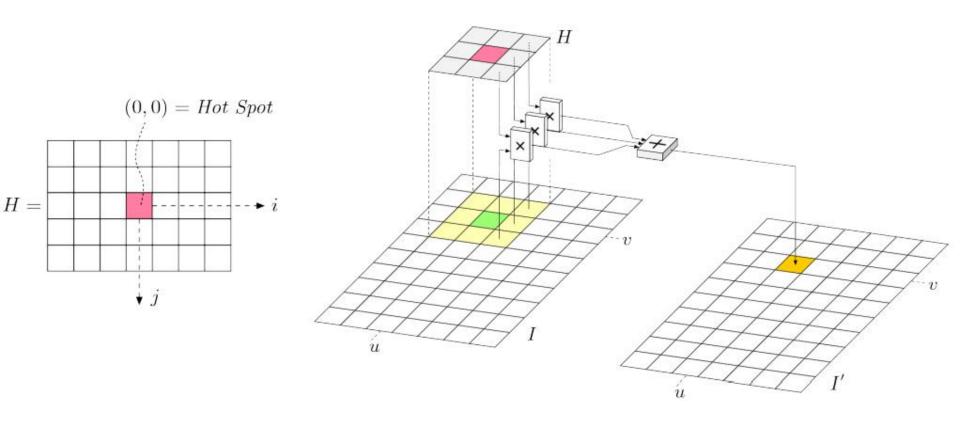

Instructor: Prof. Ming-Hsuan Yang

TA: Tiantian Wang & Tsai-Shien Chen

Spatial Filtering

• Filtering: sliding inner product

$$I'(u,v) = \sum_{i=-1}^{1} \sum_{j=-1}^{1} I(u+i,v+j) \cdot H(i,j)$$

Spatial Filtering

• Filtering: sliding inner product

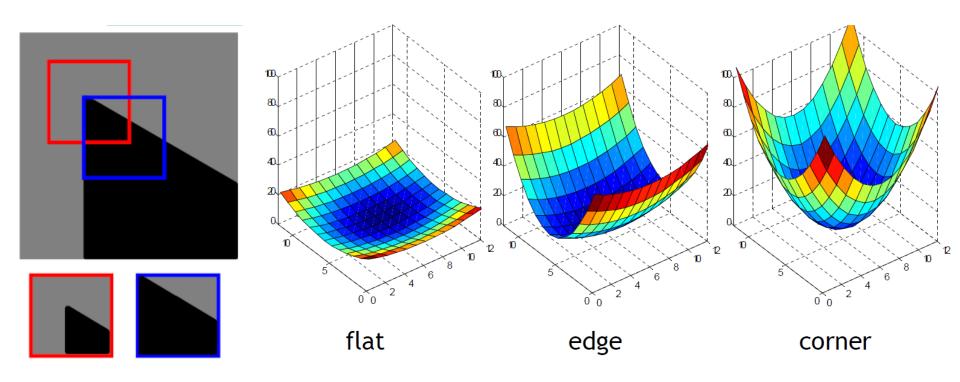

$$I'(u,v) = \sum_{i=-1}^{1} \sum_{j=-1}^{1} I(u+i,v+j) \cdot H(i,j)$$

- Notation: I' = I * H or $I' = I \otimes H$
- In MATLAB, we use imfilter(I, H) to compute spatial filtering
 - use imfilter(I, H, 'replicate') to pad
 boundaries

Harris Corner Detection

• Analyze the change of intensity for the shift [u, v]:

$$E(u,v) = \sum_{x,y} w(x,y) [I(x+u,y+v) - I(x,y)]^2$$

Harris Corner Detection

• Approximate E(u, v) with Taylor's expansion:

$$E(u,v) \cong \begin{bmatrix} u & v \end{bmatrix} M \begin{bmatrix} u \\ v \end{bmatrix}$$

-M is a 2 × 2 matrix computed from image gradients:

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

• Compute the corner response:

$$R = \det(M) - \alpha \big(\operatorname{trace}(M) \big)^2$$

• Use derivative of Gaussian (DoG) to compute image gradients:

$$I_{x} = \frac{\partial G}{\partial x} \otimes I$$
$$I_{y} = \frac{\partial G}{\partial y} \otimes I$$

- G: Gaussian function/kernel
- Derivative can be calculated by convolution/filtering:

- Sobel:
$$D_x = \begin{pmatrix} 1 & 0 & -1 \\ 2 & 0 & -2 \\ 1 & 0 & -1 \end{pmatrix}$$
 and $D_y = \begin{pmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ -1 & -2 & -1 \end{pmatrix}$

- simple one:
$$D_x = \begin{pmatrix} 1 & 0 & -1 \end{pmatrix}$$
 and $D_y = \begin{pmatrix} 1 & 0 \\ -1 \end{pmatrix}$

• Use derivative of Gaussian (DoG) to compute image gradients:

$$I_{x} = D_{x} \otimes G \otimes I$$
$$I_{y} = D_{y} \otimes G \otimes I$$

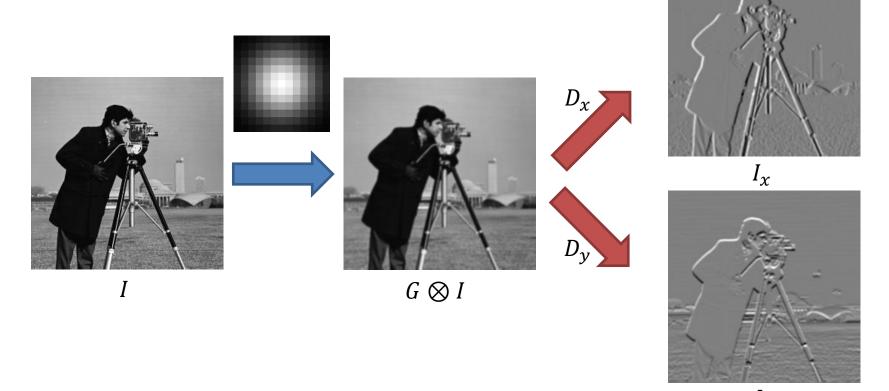

• Filtering is commutative and associative:

$$I_{x} = D_{x} \otimes (G \otimes I) = (D_{x} \otimes G) \otimes I = G \otimes (D_{x} \otimes I)$$

$$I_y = D_y \otimes (G \otimes I) = (D_y \otimes G) \otimes I = G \otimes (D_y \otimes I)$$

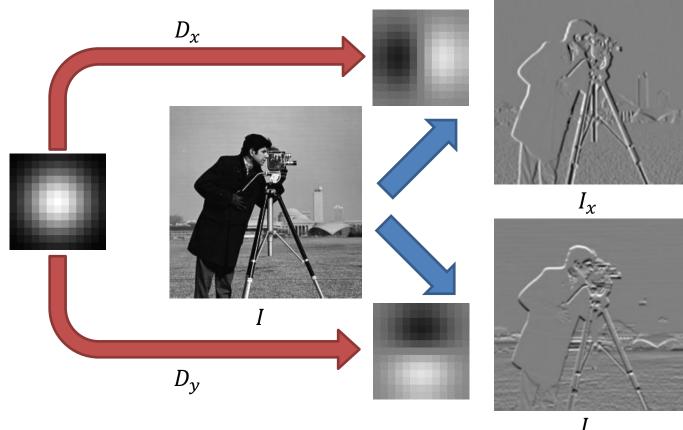

• Method 1: Apply Gaussian filtering to image, and then compute image gradients

$$I_x = D_x \otimes (G \otimes I)$$
 and $I_y = D_y \otimes (G \otimes I)$

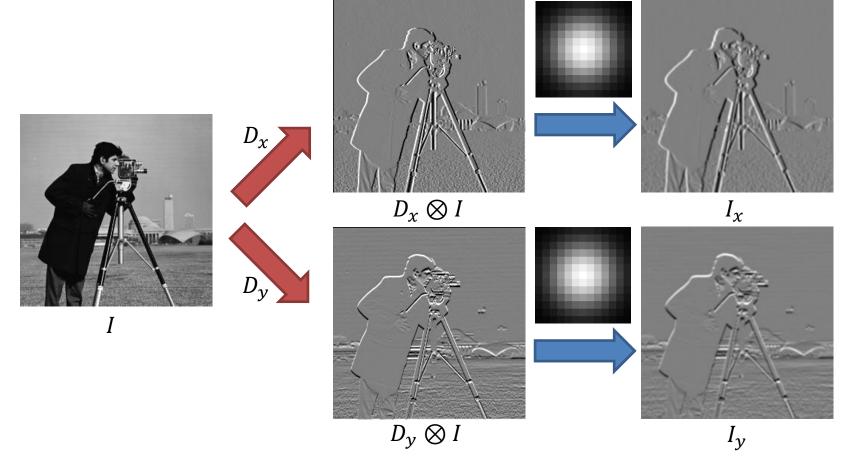

• Method 2: Compute the derivative of Gaussian, and then apply filtering to image

$$I_x = (D_x \otimes G) \otimes I$$
 and $I_y = (D_y \otimes G) \otimes I$

• Method 3: Compute the gradient of image, and then apply Gaussian filtering

$$I_x = G \otimes (D_x \otimes I)$$
 and $I_y = G \otimes (D_y \otimes I)$

Step 2: Products of Gradients

• Compute products of gradients at every pixel

$$I_{xx} = I_x \cdot I_x$$
 $I_{yy} = I_y \cdot I_y$
 $I_{xy} = I_x \cdot I_y$
Use element-wise multiplication

Step 3: Matrix M

• Use Gaussian filtering to compute the sum of products of gradients at every pixel

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix} = \begin{bmatrix} G \otimes I_x^2 & G \otimes I_x I_y \\ G \otimes I_x I_y & G \otimes I_y^2 \end{bmatrix}$$

$$S_{xx} = G \otimes I_{xx}$$

$$S_{yy} = G \otimes I_{yy}$$

$$S_{xy} = G \otimes I_{xy}$$

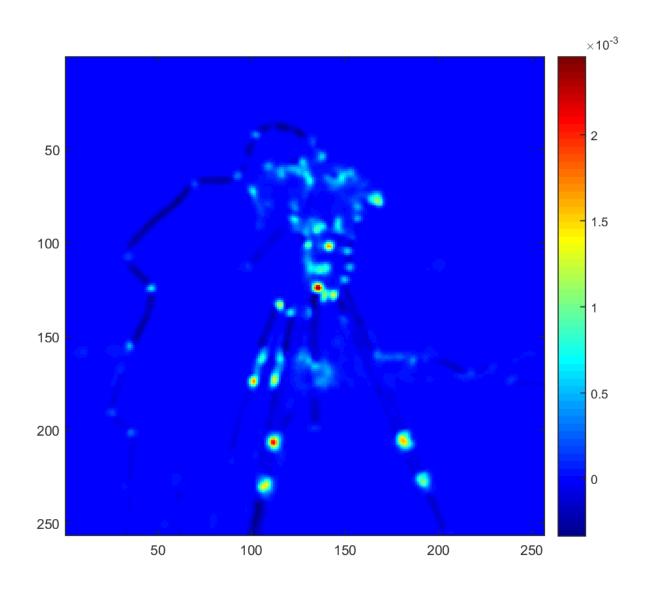

Step 4: Corner Response

• Compute the determinant and the trace of *M*:

• Compute the corner response:

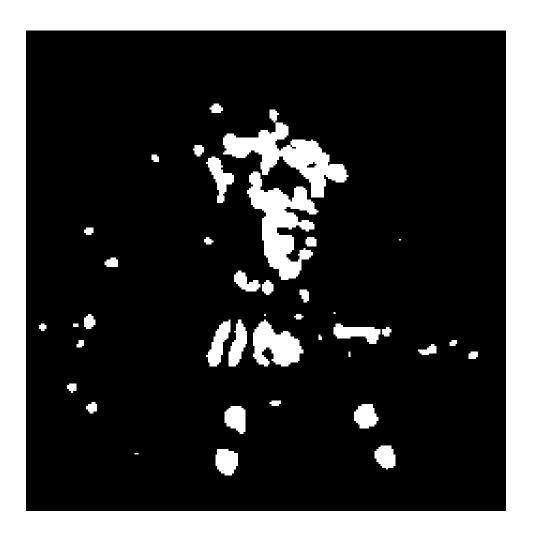

$$R = \det(M) - \alpha \big(\operatorname{trace}(M) \big)^2$$

Step 4: Corner Response

Step 4: Corner Response

• Apply thresholding on R: $R > R_{threshold}$

• Local maximum point should have *R* value greater than its all 8 neighbors

$$-R(x,y) > R(x-1,y-1)$$

$$-R(x,y) > R(x-1,y)$$

$$-R(x,y) > R(x-1,y+1)$$

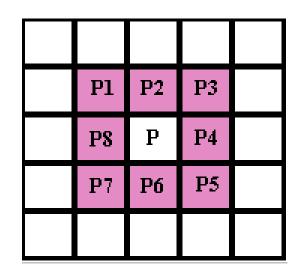

$$-R(x,y) > R(x,y-1)$$

$$-R(x,y) > R(x,y+1)$$

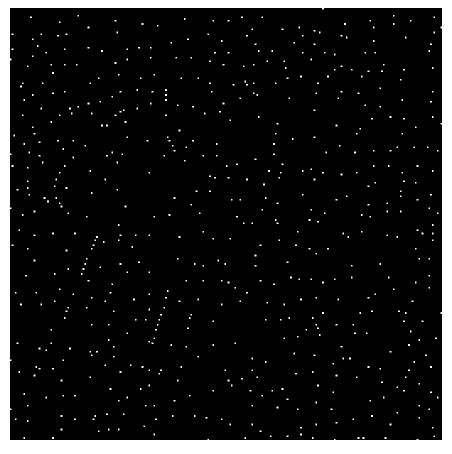

$$-R(x,y) > R(x+1,y-1)$$

$$-R(x,y) > R(x+1,y)$$

$$-R(x,y) > R(x+1,y+1)$$

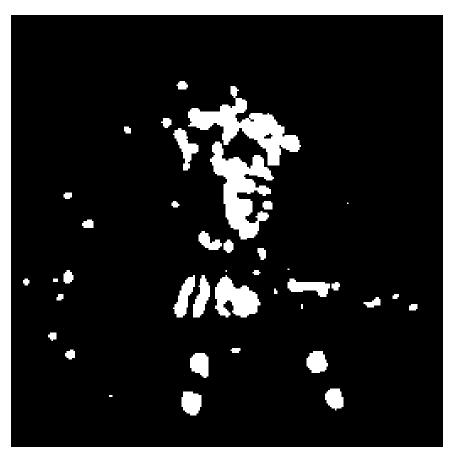

- In MATLAB, use imregionalmax (R)
- Bonus: implement your own function

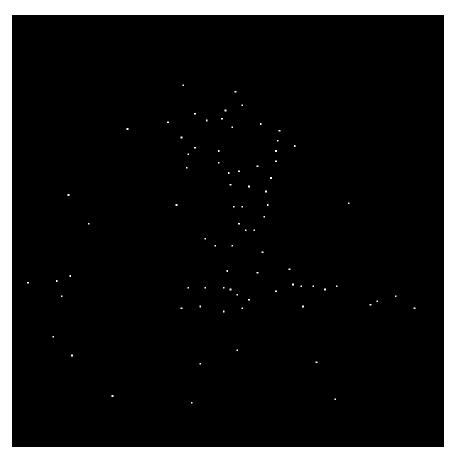

Local Maxima

• Apply AND (&) to your corner map and local-maxima

Corner Map

• Apply AND (&) to your corner map and local-maxima

Final Corner Map

Step 6: Extract corner points and plot

• Use find to extract (x, y) of corner points:

```
[corner_y, corner_x] = find(final_corner_map);
```

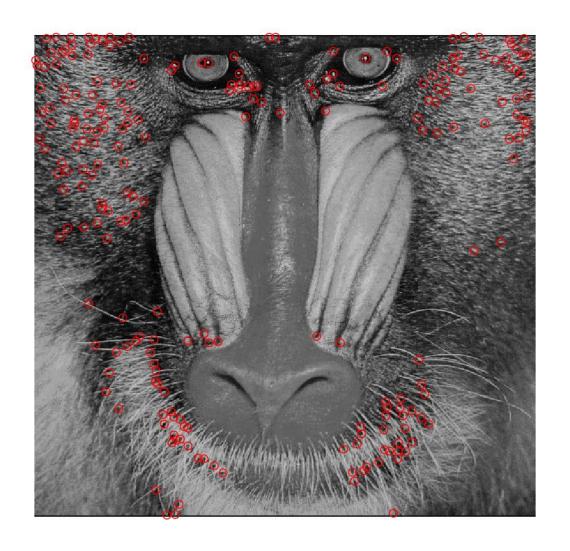

• Plot corners:

```
%% visualize results
figure, imshow(I); hold on;
plot(corner_x, corner_y, 'ro');
```

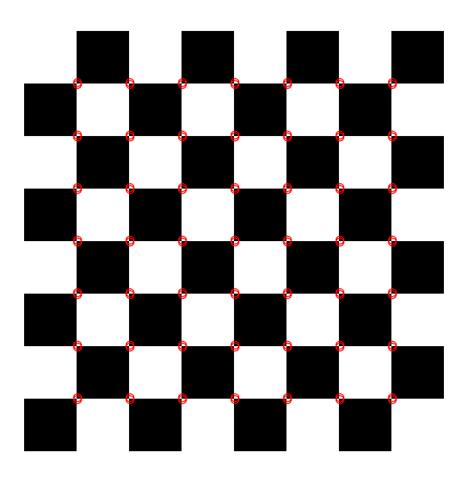

Results: cameraman

Results: baboon

Results: checkboard

Summary

1. Compute x and y gradients:

$$I_x = D_x \otimes (G_1 \otimes I)$$
 and $I_y = D_y \otimes (G_1 \otimes I)$

2. Compute products of gradients

$$I_{xx} = I_x \cdot I_x$$
 and $I_{yy} = I_y \cdot I_y$ and $I_{xy} = I_x \cdot I_y$

Different Gaussians

3. Apply Gaussian filtering

$$S_{xx} = G_2 \otimes I_{xx}$$
 and $S_{yy} = G_2 \otimes I_{yy}$ and $S_{xy} = G_2 \otimes I_{xy}$

4. Compute corner response and apply thresholding

$$R = \det(M) - \alpha \big(\operatorname{trace}(M) \big)^2$$

5. Non-maximum suppression

Lab Assignment 07

- 1. Implement Harris_corner_detector.m
- 2. Bonus: implement non-maximum suppression
- 3. Upload lab07.m, Harris_corner_detector.m and all output images (7 images for each given image) separately.
- Output images: I_x (name_Ix.png), I_y (name_Iy.png), two Corner responses in Step 4 (name_R.png, name_corner_map.png), Local Maxima (name_local_maxima.png), final corner map in Step 5 (name_final_corner_map.png) and result (name_corners.png) for each input name.png.
- Images must match the codes.
